Introduction

H-S Model

Detection in
AWGN

Detection in
Clutter and
Noise

Summary

- Components: transmitters, receivers, scene (targets and clutter), noise (low SNR)
- Under typical assumptions, range encoded as time delay and range rate encoded in frequency shift (narrowband approximation of Doppler)
- The radar chooses the transmitted waveforms and beamforms and the corresponding receiver processing

Introduction

Introduction

H-S Model

Detection in
AWGN

Detection in
Clutter and
Noise

Summary

- In a SISO radar, the scene acts on the transmitted waveform and produces the received waveform
- For typical scenarios, this transformation is well modeled as a linear operator on $L^2(\mathbb{R})$ plus noise; target and clutter operators summed
- The design objective varies with application goal (detection, classification, scene characterization)

Summary

Introduction

LTI view of radar

- Modeling of a radar scene as a linear time-invariant (LTI) system is common in the radar literature
- In particular, LTI models have received attention in connection with waveform design
- But LTI models have a fundamental limitation...

Introduction

Limitations of LTI models

Optimal
Waveform
Design

Cochran
Howard Moran

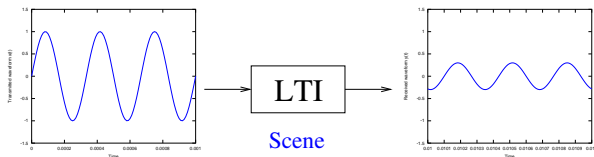

Introduction

H-S Model

Detection in
AWGN

Detection in
Clutter and
Noise

Summary

- Sinusoids are eigenfunctions of LTI systems
- So the only frequency components present in the output are those present in the input
- **LTI models cannot accommodate Doppler!**

Hilbert-Schmidt Operator Model

Hilbert-Schmidt Operators

Introduction

H-S Model

Detection in
AWGN

Detection in
Clutter and
Noise

Summary

Our proposal: Replace LTI operator scene models with Hilbert-Schmidt operator scene models, which accommodate Doppler and have other desirable features

- Fundamental building block: *displacement operator*
 $D(p, q) : L^2(\mathbb{R}) \rightarrow L^2(\mathbb{R})$ by

$$D(p, q)f(t) = e^{ipt}f(t - q)$$

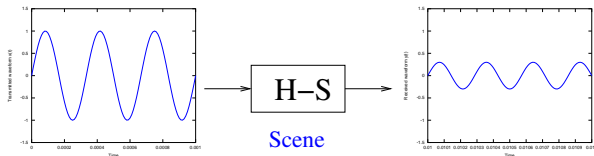

Here p denotes frequency shift and q time shift; the (p, q) notation is adopted from physics where they are standard for phase space coordinates

- Every Hilbert-Schmidt class operator
 $S : L^2(\mathbb{R}) \rightarrow L^2(\mathbb{R})$ can be written as a superposition of displacement operators

$$S = \int_p \int_q s(p, q) D(p, q) dp dq$$

Hilbert-Schmidt Operator Model

Properties of Hilbert-Schmidt Operators

- H-S operators can impart frequency shifts as well as time and phase shifts
- So HS models **can** accommodate Doppler
- LTI (convolutional) operators are a subclass of the H-S class
- But...

$$D(p, q)D(p', q') = D(p', q')D(p, q)e^{i(pq' - p'q)}$$

i.e., H-S operators are generally non-commutative

Introduction

H-S Model

Detection in
AWGN

Detection in
Clutter and
Noise

Summary

- *Discrete target with position (p_0, q_0) :*

$$\sum_{(p,q) \in N(0,0)} s_t(p, q) D(p, q) \quad D(p_0, q_0)$$

- *Clutter:*

$$\sum_{(p,q)} s_c(p, q) D(p, q)$$

e.g., Markov random field, homogeneous, Gaussian...

- Both target and clutter are often sparse, but not in a finite library
- *Noise:* Additive Gaussian $n(t)$

Hilbert-Schmidt Operator Model

H-S Model

Detection in
AWGN

Detection in
Clutter and
Noise

Summary

Standard radar set-up...

- *Transmitter*: Baseband waveform $w(t)$ with modulation to carrier frequency p_0
- *Receiver*: Demodulation plus signal processing (H)

Typical goal:

Define optimal systems (waveform w & processing H) for various classes of problems, ultimately with *constraints* (e.g., power, bandwidth, time) on w

Summary

Receiver data at baseband...

- *Target present* (H_1)

$$x(t) = \sum_{(p,q) \in N(0,0)} s_t(p,q) D(p_0, q_0)^\dagger$$

$$\cdot D(p, q) D(p_0, q_0) w(t) + n(t)$$

$$= Bw(t) + n(t) \sim \mathcal{N}(Bw(t), \sigma^2)$$

where $D(p_0, q_0)^\dagger = \exp(ip_0 q_0) D(-p_0, -q_0)$ is the adjoint of $D(p_0, q_0)$

- *Target absent* (H_0)

$$x(t) = n(t) \sim \mathcal{N}(0, \sigma^2)$$

Basic Detection Problem

Waveform optimization

Design

Cochran
Howard Moran

Introduction

H-S Model

Detection in
AWGN

Detection in
Clutter and
Noise

Summary

- Define

$$B = \sum_{(p,q) \in N(0,0)} s_t(p, q) D(p_0, q_0)^\dagger D(p, q) D(p_0, q_0)$$

- Detection is optimized for fixed $\|w\|$ if $\|Bw\|^2$ is maximized; i.e., w should maximize

$$\langle Bw, Bw \rangle = \langle w, B^\dagger Bw \rangle$$

and should thus be an eigenfunction of the non-negative definite operator $B^\dagger B$ corresponding to its maximal eigenvalue

- If w is constrained by power rather than energy, the solution changes (another day...)

Introduction

H-S Model

Detection in
AWGN

Detection in
Clutter and
Noise

Summary

- Signal at the receiver

$$s(t) = Tw(t) + Cw(t) + n(t)$$

- T is a H-S class target operator
- C is a H-S class clutter operator
- n is white Gaussian noise
- Receiver processes s with a H-S operator H
- Detection decision on the basis of the statistic¹

$$r(t_0) = Hs(t_0) = (HTw + HCw + Hn)(t_0)$$

Basic Detection Problem

SINR

Optimal
Waveform
Design

Cochran
Howard Moran

Introduction

H-S Model

Detection in
AWGN

Detection in
Clutter and
Noise

Summary

- The associated signal to interference plus noise ratio (SINR) is

$$\text{SINR}(t_0) = \frac{|HTw(t_0)|^2}{E|HCw(t_0) + Hn(t_0)|^2} \quad (1)$$

- The initial objective is to maximize $\text{SINR}(t_0)$ for a given waveform w
 - The problem of optimizing over w comes up later

Basic Detection Problem

Noise Term

Optimal
Waveform
Design

Cochran
Howard Moran

Introduction

H-S Model

Detection in
AWGN

Detection in
Clutter and
Noise

Summary

- H may be represented as an integral operator with kernel $\Phi : \mathbb{R}^2 \rightarrow \mathbb{C}$

$$Hf(t) = \int_{\mathbb{R}} \Phi(t, \tau) f(\tau) d\tau$$

- By direct calculation,

$$\mathbb{E}|Hn(t)|^2 = \sigma^2 \int |\Phi(t, \tau)|^2 d\tau$$

- Denoting $h_{t_0} = \Phi(t_0, \cdot)$, this gives

$$\mathbb{E}|Hn(t_0)|^2 = \sigma^2 \|h_{t_0}\|^2 \quad (2)$$

Basic Detection Problem

Clutter Term

- For the clutter term,

$$\begin{aligned} |HCw(t_0)|^2 &= \int \int h_{t_0}(\tau) \overline{h_{t_0}(u)} Cw(\tau) \overline{Cw(u)} d\tau du \\ &= \langle h_{t_0}, G_C h_{t_0} \rangle \end{aligned} \quad (3)$$

- $G_C \geq 0$ is a “waveform dependent” Hermitian operator defined by

$$G_C f(t) = \int_{\mathbb{R}} \mathbb{E}[Cw(t) \overline{Cw(\tau)}] f(\tau) d\tau$$

- Note that the clutter operator may be regarded as random; no issues if n has zero mean and is independent of C
- For deterministic (known) clutter

$$G_C = CP_w C^\dagger$$

where P_w is projection onto span w .

Basic Detection Problem

Signal Term and Maximization Formulation

- In inner product form, the SINR numerator is

$$|HTw(t_0)|^2 = \langle h_{t_0}, P_{Tw} h_{t_0} \rangle \quad (4)$$

- P_{Tw} is the rank-one projection operator onto $\text{span } Tw$
- Substituting (2), (3), and (4) into (1) yields

$$\text{SINR}(t_0) = \frac{\langle h_{t_0}, P_{Tw} h_{t_0} \rangle}{\langle h_{t_0}, (\sigma^2 \mathbb{I} + G_C) h_{t_0} \rangle} \quad (5)$$

- SINR maximization is thus a generalized eigenvalue problem
 - $P_{Tw} > 0$ with rank one
 - $G_C \geq 0$, so $(\sigma^2 \mathbb{I} + G_C) > 0$ provided $\sigma^2 > 0$
- Hence SINR is maximized by setting

$$h_{t_0} = h_{\max} = (\sigma^2 \mathbb{I} + G_C)^{-1/2} Tw$$

Basic Detection Problem

Maximizing SINR

Optimal
Waveform
Design

Cochran
Howard Moran

Introduction

H-S Model

Detection in
AWGN

Detection in
Clutter and
Noise

Summary

- Denote $G = (\sigma^2 \mathbb{I} + G_C) > 0$ and observe G is self-adjoint
- Then $h_{\max} = G^{-1/2}Tw$

$$\text{SINR}_{\max} = \frac{\langle G^{-1/2}Tw, P_{Tw}G^{-1/2}Tw \rangle}{\langle G^{-1/2}Tw, G^{1/2}Tw \rangle}$$

- With $f = Tw$,

$$\begin{aligned} \text{SINR}_{\max} &= \frac{\langle G^{-1/2}f, P_{Tw}G^{-1/2}f \rangle}{\langle G^{-1/2}f, G^{1/2}f \rangle} \\ &= \frac{\langle f, G^{-1/2}P_{Tw}G^{-1/2}f \rangle}{\langle f, f \rangle} \end{aligned}$$

Basic Detection Problem

Maximizing SINR (cont'd)

Optimal
Waveform
Design

Cochran
Howard Moran

Introduction

H-S Model

Detection in
AWGN

Detection in
Clutter and
Noise

Summary

- SINR_{\max} is the maximal eigenvalue of $G^{-1/2}P_{Tw}G^{-1/2} \geq 0$
 - Rank-one \implies its trace is its one positive eigenvalue

- Hence

$$\begin{aligned}\text{SINR}_{\max} &= \text{Tr}(G^{-1/2}P_{Tw}G^{-1/2}) \\ &= \langle G^{-1/2}f, G^{-1/2}f \rangle \\ &= \langle f, G^{-1}f \rangle = \langle Tw, G^{-1}Tw \rangle \\ &= \langle Tw, (\sigma^2\mathbb{I} + G_C)^{-1}Tw \rangle\end{aligned}$$

- This reduces to past results for LTI scene models

Basic Detection Problem

Waveform Optimization

Optimal
Waveform
Design

Cochran
Howard Moran

Introduction

H-S Model

Detection in
AWGN

Detection in
Clutter and
Noise

Summary

- With deterministic clutter operator C , the problem of finding a waveform w_{\max} to maximize the SINR is

$$w_{\max} = \arg \max \left\langle Tw, (\sigma^2 \mathbb{I} + CP_w C^\dagger)^{-1} Tw \right\rangle$$

- The presence of P_w in the denominator makes this problem “non-linear”
- We are investigating an iterative algorithm
 - 1 Take w_0 to be an eigenvector corresponding to the largest eigenvalue of $T^\dagger T$ (“target-driven”)
 - 2 For $k > 0$, solve the “linear” problem

$$w_1 = \arg \max \left\langle Tw, (\sigma^2 \mathbb{I} + CP_{w_{k-1}} C^\dagger)^{-1} Tw \right\rangle$$

- “Clutter-driven” perspective leads to the same idea

Determining the Scene

Can we get the scene operator from a few measurements?

Optimal
Waveform
Design

Cochran
Howard Moran

Introduction

H-S Model

Detection in
AWGN

Detection in
Clutter and
Noise

Summary

- The preceding examples assume the scene operator is known or hypothetical scene operators are being tested
- Scene operators are often composed of a sparse superposition of $D(p, q)$ operators
- Radar measures the operator one dimension at a time; time is often limited
- Sparsity assumptions of radar scenes may be helpful in regularizing this problem, but there are issues...
 - Operators are infinite-dimensional
 - Sparsity is not in a finite set, and is not usually well approximated this way
 - The SNR is usually *very* low

Summary

Summary and Ongoing Work

Optimal
Waveform
Design

Cochran
Howard Moran

Introduction

H-S Model

Detection in
AWGN

Detection in
Clutter and
Noise

Summary

- Hilbert-Schmidt class operators may be suitable to model radar scenes with Doppler
- Standard detection and waveform optimization problems can be formulated and solved in this framework
- The problem of determining such operators from small numbers of rank-one measurements has not been treated, at least in the radar literature
- Sparsity assumptions of radar scenes may be helpful in regularizing this problem
